# AGFWCM | Edge-Centric Drift Interpretability

## 1 | Evidence trajectory and alarm moments

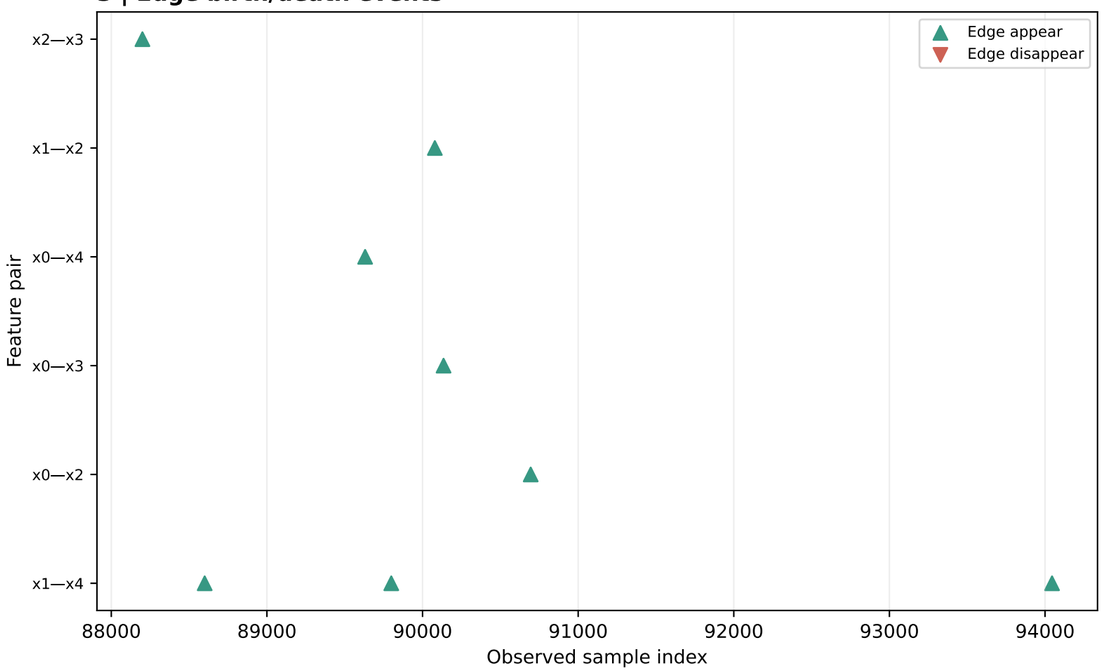

## 2 | Strongest 10 edge changes over time

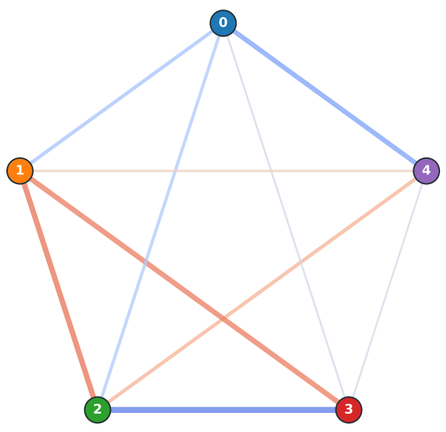

## 3 | Edge birth/death events

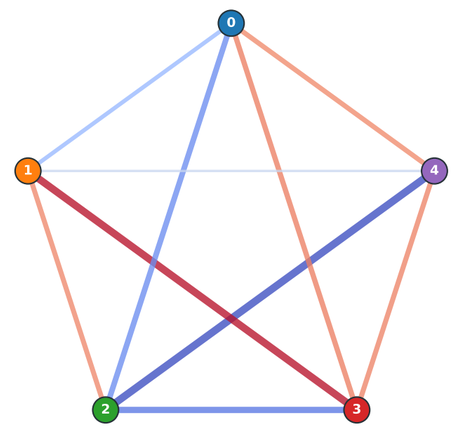

## 4 | Reference relationships (same selected edges)

Edge color: negative ↔ positive correlation | Width: |correlation|

## 5 | Observed relationships near sample 32,391

Edge color: negative ↔ positive correlation | Width: |correlation|

Interpretation: heatmap color shows signed relationship change; edge events mark threshold crossings; graph panels contrast reference relationships with observed relationships near the strongest alarm. These are associations, not causal effects.
