AGFWCM | Edge-Centric Drift Interpretability

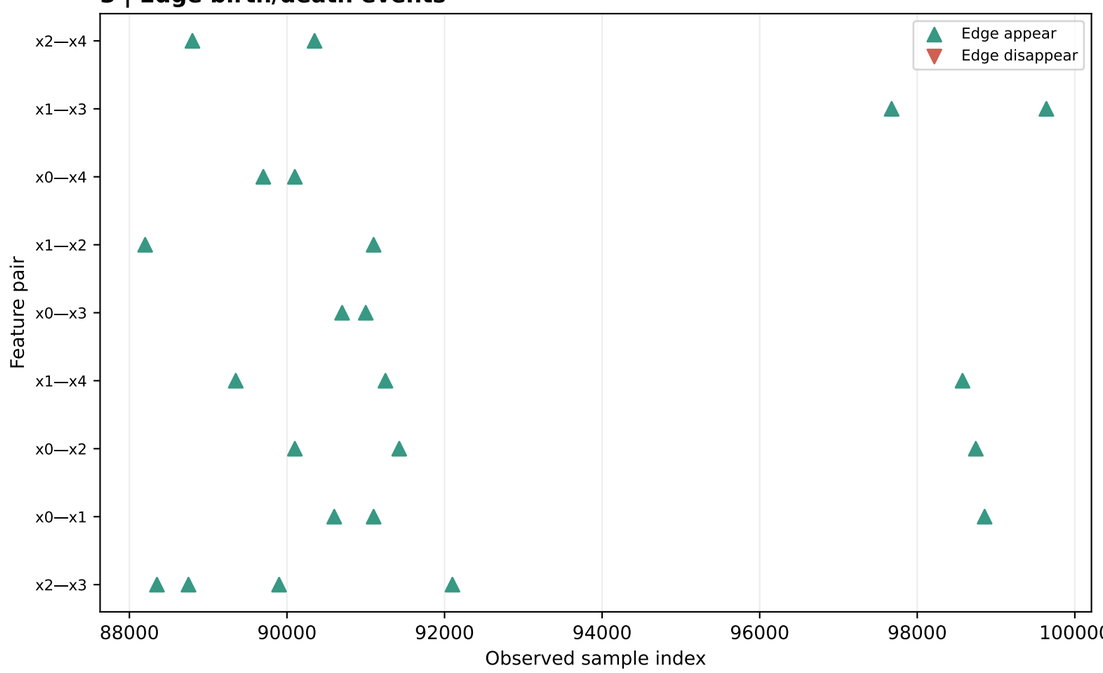

1 | Evidence trajectory and alarm moments

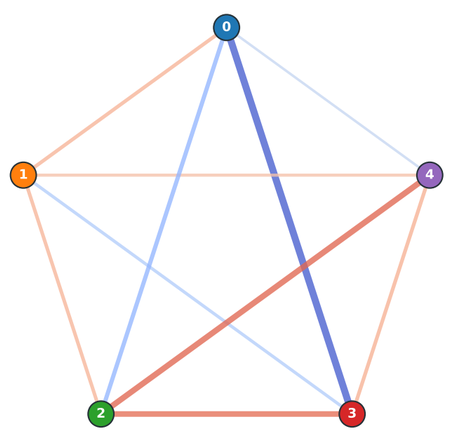

2 | Strongest 10 edge changes over time

3 | Edge birth/death events

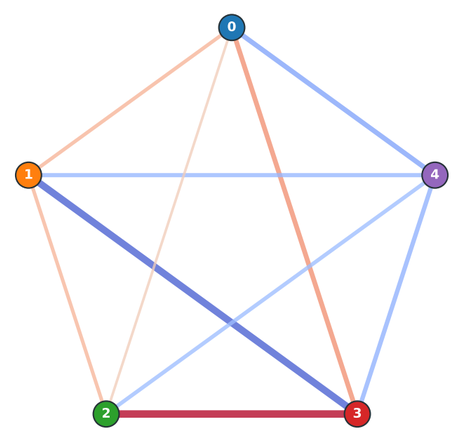

4 | Reference relationships (same selected edges)

Edge color: negative ↔ positive correlation | Width: |correlation|

5 | Observed relationships near sample 32,528

Edge color: negative ↔ positive correlation | Width: |correlation|

Interpretation: heatmap color shows signed relationship change, edge events mark threshold crossings, graph panels contrast reference relationships with observed relationships near the strongest alarm. These are associations, not causal effects.
