AGFWCM | Edge-Centric Drift Interpretability

1 | Evidence trajectory and alarm moments

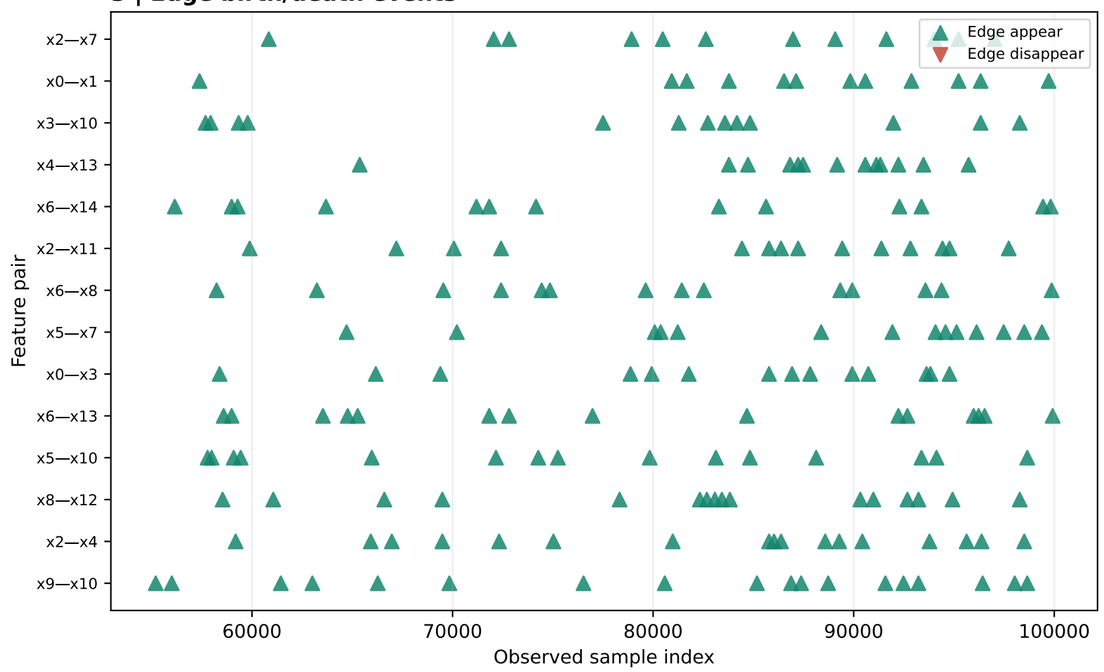

2 | Strongest 18 edge changes over time

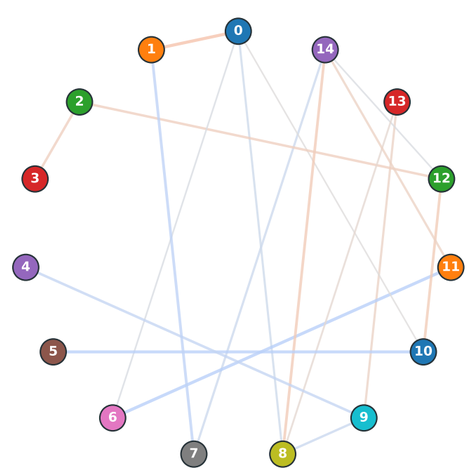

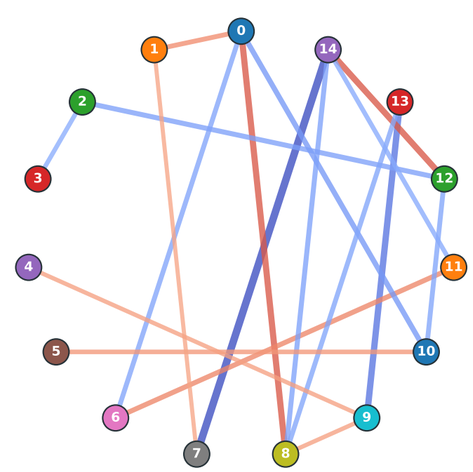

3 | Edge birth/death events

4 | Reference relationships (same selected edges)

5 | Observed relationships near sample 38,229

Interpretation: heatmap color shows signed relationship change, edge events mark threshold crossings, graph panels contrast reference relationships with observed relationships near the strongest alarm. These are associations, not causal effects.
