# AGFWCM | Edge-Centric Drift Interpretability

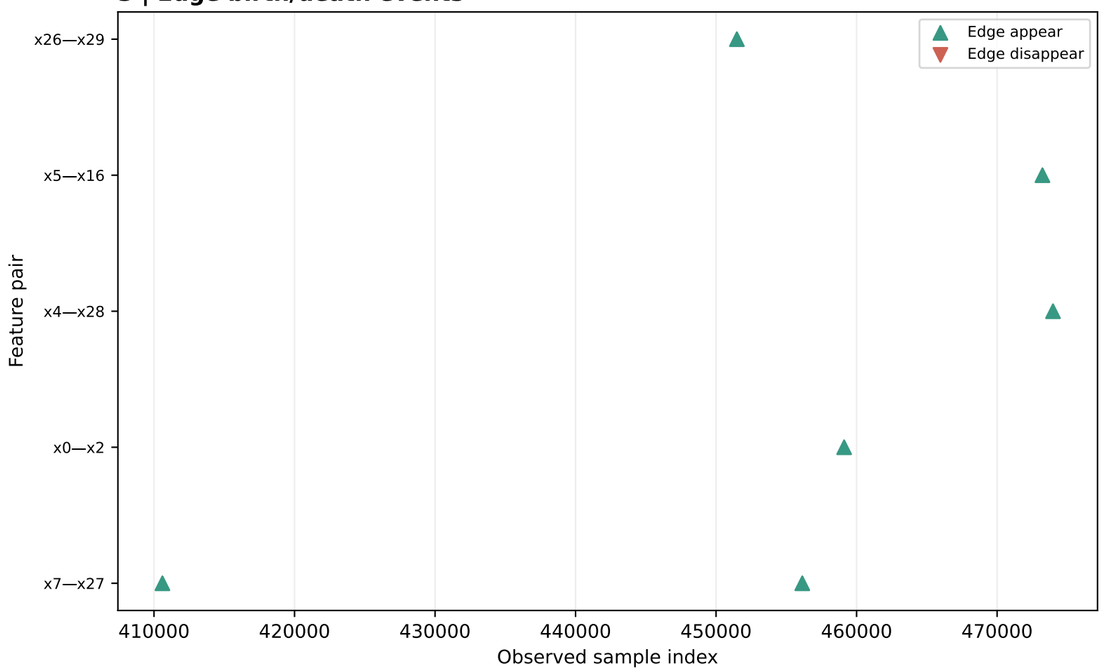

## 1 | Evidence trajectory and alarm moments

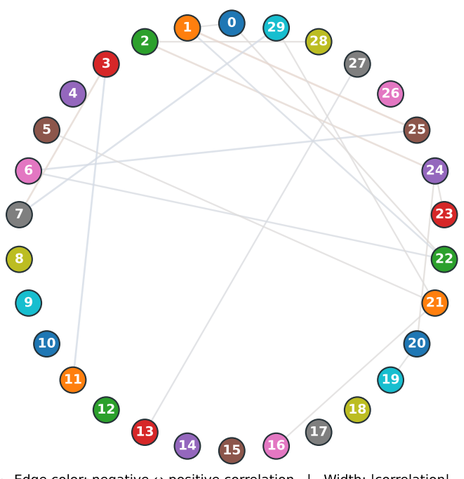

## 2 | Strongest 18 edge changes over time

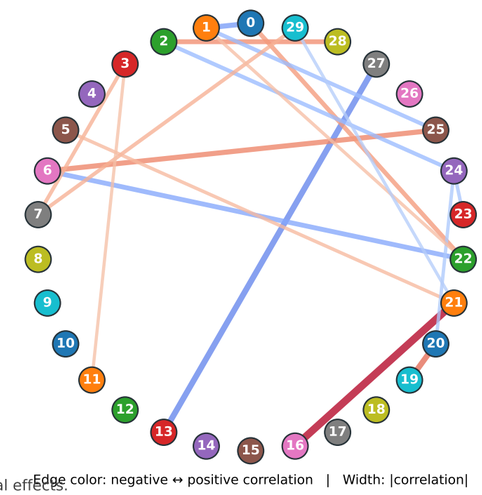

## 3 | Edge birth/death events

## 4 | Reference relationships (same selected edges)

## 5 | Observed relationships near sample 160,834

Interpretation: heatmap color shows signed relationship change; edge events mark threshold crossings; graph panels contrast reference relationships with observed relationships near the strongest alarm. These are associations, not causal effects.
